

## 16. Binary Search Trees

[Ottman/Widmayer, Kap. 5.1, Cormen et al, Kap. 12.1 - 12.3]

### Dictionary implementation

Hashing: implementation of dictionaries with expected very fast access times.

Disadvantages of hashing: linear access time in worst case. **Some operations not supported at all:**

- enumerate keys in increasing order
- next smallest key to given key
- Key  $k$  in given interval  $k \in [l, r]$

465

466

### Trees

Trees are

- Generalized lists: nodes can have more than one successor
- Special graphs: graphs consist of nodes and edges. A tree is a fully connected, directed, acyclic graph.

### Trees

Use

- Decision trees: hierarchic representation of decision rules
- syntax trees: parsing and traversing of expressions, e.g. in a compiler
- Code trees: representation of a code, e.g. morse alphabet, huffman code
- Search trees: allow efficient searching for an element by value

467

468

## Examples

469

## Examples

470

## Nomenclature

- Order of the tree: maximum number of child nodes, here: 3
- Height of the tree: maximum path length root – leaf (here: 4)

471

## Binary Trees

A binary tree is

- either a leaf, i.e. an empty tree,
- or an inner leaf with two trees  $T_l$  (left subtree) and  $T_r$  (right subtree) as left and right successor.

In each inner node  $v$  we store

key	
left	right

- a key  $v.key$  and
- two nodes  $v.left$  and  $v.right$  to the roots of the left and right subtree.

a leaf is represented by the **null**-pointer

472

## Binary search tree

A binary search tree is a binary tree that fulfils the *search tree property*:

- Every node  $v$  stores a key
- Keys in left subtree  $v.left$  are smaller than  $v.key$
- Keys in right subtree  $v.right$  are greater than  $v.key$

473

## Searching

**Input:** Binary search tree with root  $r$ , key  $k$

**Output:** Node  $v$  with  $v.key = k$  or **null**

$v \leftarrow r$

**while**  $v \neq \text{null}$  **do**

**if**  $k = v.key$  **then**

**return**  $v$

**else if**  $k < v.key$  **then**

$v \leftarrow v.left$

**else**

$v \leftarrow v.right$

**return null**

474

## Height of a tree

The height  $h(T)$  of a binary tree  $T$  with root  $r$  is given by

$$h(r) = \begin{cases} 0 & \text{if } r = \text{null} \\ 1 + \max\{h(r.left), h(r.right)\} & \text{otherwise.} \end{cases}$$

The worst case run time of the search is thus  $\mathcal{O}(h(T))$

475

## Insertion of a key

Insertion of the key  $k$

- Search for  $k$
- If successful search: output error
- Of no success: insert the key at the leaf reached

476

## Remove node

Three cases possible:

- Node has no children
- Node has one child
- Node has two children

[Leaves do not count here]

## Remove node

Node has no children

Simple case: replace node by leaf.

477

478

## Remove node

Node has one child

Also simple: replace node by single child.

## Remove node

Node  $v$  has two children

The following observation helps: the smallest key in the right subtree  $v.right$  (the *symmetric successor* of  $v$ )

- is smaller than all keys in  $v.right$
- is greater than all keys in  $v.left$
- and cannot have a left child.

Solution: replace  $v$  by its symmetric successor.

479

480

## By symmetry...

Node  $v$  has two children

Also possible: replace  $v$  by its symmetric predecessor.

## Algorithm SymmetricSuccessor( $v$ )

**Input:** Node  $v$  of a binary search tree.

**Output:** Symmetric successor of  $v$

$w \leftarrow v.\text{right}$

$x \leftarrow w.\text{left}$

**while**  $x \neq \text{null}$  **do**

$w \leftarrow x$

$x \leftarrow x.\text{left}$

**return**  $w$

481

482

## Analysis

Deletion of an element  $v$  from a tree  $T$  requires  $\mathcal{O}(h(T))$  fundamental steps:

- Finding  $v$  has costs  $\mathcal{O}(h(T))$
- If  $v$  has maximal one child unequal to **null** then removal takes  $\mathcal{O}(1)$  steps
- Finding the symmetric successor  $n$  of  $v$  takes  $\mathcal{O}(h(T))$  steps. Removal and insertion of  $n$  takes  $\mathcal{O}(1)$  steps.

## Traversal possibilities

- preorder:  $v$ , then  $T_{\text{left}}(v)$ , then  $T_{\text{right}}(v)$ .  
8, 3, 5, 4, 13, 10, 9, 19
- postorder:  $T_{\text{left}}(v)$ , then  $T_{\text{right}}(v)$ , then  $v$ .  
4, 5, 3, 9, 10, 19, 13, 8
- inorder:  $T_{\text{left}}(v)$ , then  $v$ , then  $T_{\text{right}}(v)$ .  
3, 4, 5, 8, 9, 10, 13, 19

483

484

## Further supported operations

- $\text{Min}(T)$ : Read-out minimal value in  $\mathcal{O}(h)$
- $\text{ExtractMin}(T)$ : Read-out and remove minimal value in  $\mathcal{O}(h)$
- $\text{List}(T)$ : Output the sorted list of elements
- $\text{Join}(T_1, T_2)$ : Merge two trees with  $\max(T_1) < \min(T_2)$  in  $\mathcal{O}(n)$ .

485

## Degenerated search trees

486

## Probabilistically

A search tree constructed from a random sequence of numbers provides an expected path length of  $\mathcal{O}(\log n)$ .

Attention: this only holds for insertions. If the tree is constructed by random insertions and deletions, the expected path length is  $\mathcal{O}(\sqrt{n})$ .

*Balanced* trees make sure (e.g. with *rotations*) during insertion or deletion that the tree stays balanced and provide a  $\mathcal{O}(\log n)$  Worst-case guarantee.

487

## 17. AVL Trees

Balanced Trees [Ottman/Widmayer, Kap. 5.2-5.2.1, Cormen et al, Kap. Problem 13-3]

488

## Objective

Searching, insertion and removal of a key in a tree generated from  $n$  keys inserted in random order takes expected number of steps  $\mathcal{O}(\log_2 n)$ .

But worst case  $\Theta(n)$  (degenerated tree).

**Goal:** avoidance of degeneration. Artificial balancing of the tree for each update-operation of a tree.

Balancing: guarantee that a tree with  $n$  nodes always has a height of  $\mathcal{O}(\log n)$ .

**Adelson-Venskii and Landis (1962): AVL-Trees**

## Balance of a node

The height *balance* of a node  $v$  is defined as the height difference of its sub-trees  $T_l(v)$  and  $T_r(v)$

$$\text{bal}(v) := h(T_r(v)) - h(T_l(v))$$

489

490

## AVL Condition

*AVL Condition: for each node  $v$  of a tree  $\text{bal}(v) \in \{-1, 0, 1\}$*

## (Counter-)Examples

491

492

## Number of Leaves

- 1. observation: a binary search tree with  $n$  keys provides exactly  $n + 1$  leaves. Simple induction argument.
  - The binary search tree with  $n = 0$  keys has  $m = 1$  leaves
  - When a key is added ( $n \rightarrow n + 1$ ), then it replaces a leaf and adds two new leaves ( $m \rightarrow m - 1 + 2 = m + 1$ ).
- 2. observation: a lower bound of the number of leaves in a search tree with given height implies an upper bound of the height of a search tree with given number of keys.

## Lower bound of the leaves

AVL tree with height 1 has  $N(1) := 2$  leaves.

AVL tree with height 2 has at least  $N(2) := 3$  leaves.

493

494

## Lower bound of the leaves for $h > 2$

- Height of one subtree  $\geq h - 1$ .
  - Height of the other subtree  $\geq h - 2$ .
- Minimal number of leaves  $N(h)$  is

$$N(h) = N(h - 1) + N(h - 2)$$

Overall we have  $N(h) = F_{h+2}$  with **Fibonacci-numbers**  $F_0 := 0$ ,  $F_1 := 1$ ,  $F_n := F_{n-1} + F_{n-2}$  for  $n > 1$ .

## Fibonacci Numbers, closed Form

It holds that<sup>28</sup>

$$F_i = \frac{1}{\sqrt{5}}(\phi^i - \hat{\phi}^i)$$

with the roots  $\phi, \hat{\phi}$  of the golden ratio equation  $x^2 - x - 1 = 0$ :

$$\phi = \frac{1 + \sqrt{5}}{2} \approx 1.618$$

$$\hat{\phi} = \frac{1 - \sqrt{5}}{2} \approx -0.618$$

<sup>28</sup>Derivation using generating functions (power series) in the appendix.

495

496

## Fibonacci Numbers, Inductive Proof

$$F_i \stackrel{!}{=} \frac{1}{\sqrt{5}}(\phi^i - \hat{\phi}^i) \quad [*] \quad \left( \phi = \frac{1+\sqrt{5}}{2}, \hat{\phi} = \frac{1-\sqrt{5}}{2} \right).$$

- 1 Immediate for  $i = 0, i = 1$ .
- 2 Let  $i > 2$  and claim  $[*]$  true for all  $F_j, j < i$ .

$$\begin{aligned} F_i &\stackrel{def}{=} F_{i-1} + F_{i-2} \stackrel{[*]}{=} \frac{1}{\sqrt{5}}(\phi^{i-1} - \hat{\phi}^{i-1}) + \frac{1}{\sqrt{5}}(\phi^{i-2} - \hat{\phi}^{i-2}) \\ &= \frac{1}{\sqrt{5}}(\phi^{i-1} + \phi^{i-2}) - \frac{1}{\sqrt{5}}(\hat{\phi}^{i-1} + \hat{\phi}^{i-2}) = \frac{1}{\sqrt{5}}\phi^{i-2}(\phi + 1) - \frac{1}{\sqrt{5}}\hat{\phi}^{i-2}(\hat{\phi} + 1) \\ &(\phi, \hat{\phi} \text{ fulfil } x + 1 = x^2) \\ &= \frac{1}{\sqrt{5}}\phi^{i-2}(\phi^2) - \frac{1}{\sqrt{5}}\hat{\phi}^{i-2}(\hat{\phi}^2) = \frac{1}{\sqrt{5}}(\phi^i - \hat{\phi}^i). \end{aligned}$$

497

## Tree Height

Because  $|\hat{\phi}| < 1$ , overall we have

$$N(h) \in \Theta \left( \left( \frac{1+\sqrt{5}}{2} \right)^h \right) \subseteq \Omega(1.618^h)$$

and thus

$$\begin{aligned} N(h) &\geq c \cdot 1.618^h \\ \Rightarrow h &\leq 1.44 \log_2 n + c'. \end{aligned}$$

An AVL tree is asymptotically not more than 44% higher than a perfectly balanced tree.<sup>29</sup>

<sup>29</sup>The perfectly balanced tree has a height of  $\lceil \log_2 n + 1 \rceil$

498

## Insertion

### Balance

- Keep the balance stored in each node
- Re-balance the tree in each update-operation

New node  $n$  is inserted:

- Insert the node as for a search tree.
- Check the balance condition increasing from  $n$  to the root.

## Balance at Insertion Point

Finished in both cases because the subtree height did not change

499

500

## Balance at Insertion Point

case 3.1:  $\text{bal}(p) = 0$  right

case 3.2:  $\text{bal}(p) = 0$ , left

Not finished in both case. Call of  $\text{upin}(p)$

## $\text{upin}(p)$ - invariant

When  $\text{upin}(p)$  is called it holds that

- the subtree from  $p$  is grown and
- $\text{bal}(p) \in \{-1, +1\}$

501

502

## $\text{upin}(p)$

Assumption:  $p$  is left son of  $pp$ <sup>30</sup>

case 1:  $\text{bal}(pp) = +1$ , done.

case 2:  $\text{bal}(pp) = 0$ ,  $\text{upin}(pp)$

case 3:  $\text{bal}(pp) = -1$ ,

In both cases the AVL-Condition holds for the subtree from  $pp$

## $\text{upin}(p)$

Assumption:  $p$  is left son of  $pp$

This case is problematic: adding  $n$  to the subtree from  $pp$  has violated the AVL-condition. Re-balance!

Two cases  $\text{bal}(p) = -1$ ,  $\text{bal}(p) = +1$

<sup>30</sup>If  $p$  is a right son: symmetric cases with exchange of  $+1$  and  $-1$

503

504

# Rotations

case 1.1  $\text{bal}(p) = -1$ .<sup>31</sup>

<sup>31</sup>  $p$  right son:  $\Rightarrow \text{bal}(pp) = \text{bal}(p) = +1$ , left rotation

# Rotations

case 1.1  $\text{bal}(p) = -1$ .<sup>32</sup>

<sup>32</sup>  $p$  right son  $\Rightarrow \text{bal}(pp) = +1$ ,  $\text{bal}(p) = -1$ , double rotation right left

# Analysis

- Tree height:  $\mathcal{O}(\log n)$ .
- Insertion like in binary search tree.
- Balancing via recursion from node to the root. Maximal path length  $\mathcal{O}(\log n)$ .

Insertion in an AVL-tree provides run time costs of  $\mathcal{O}(\log n)$ .

# Deletion

Case 1: Children of node  $n$  are both leaves Let  $p$  be parent node of  $n$ .  $\Rightarrow$  Other subtree has height  $h' = 0, 1$  or  $2$ .

- $h' = 1$ : Adapt  $\text{bal}(p)$ .
- $h' = 0$ : Adapt  $\text{bal}(p)$ . Call **upout** ( $p$ ).
- $h' = 2$ : Rebalanciere des Teilbaumes. Call **upout** ( $p$ ).

## Deletion

Case 2: one child  $k$  of node  $n$  is an inner node

- Replace  $n$  by  $k$ . **upout(k)**

509

## Deletion

Case 3: both children of node  $n$  are inner nodes

- Replace  $n$  by symmetric successor. **upout(k)**
- Deletion of the symmetric successor is as in case 1 or 2.

510

## upout(p)

Let  $pp$  be the parent node of  $p$ .

(a)  $p$  left child of  $pp$

- 1  $\text{bal}(pp) = -1 \Rightarrow \text{bal}(pp) \leftarrow 0$ . **upout(pp)**
- 2  $\text{bal}(pp) = 0 \Rightarrow \text{bal}(pp) \leftarrow +1$ .
- 3  $\text{bal}(pp) = +1 \Rightarrow$  next slides.

(b)  $p$  right child of  $pp$ : Symmetric cases exchanging  $+1$  and  $-1$ .

## upout(p)

Case (a).3:  $\text{bal}(pp) = +1$ . Let  $q$  be brother of  $p$   
 (a).3.1:  $\text{bal}(q) = 0$ .<sup>33</sup>

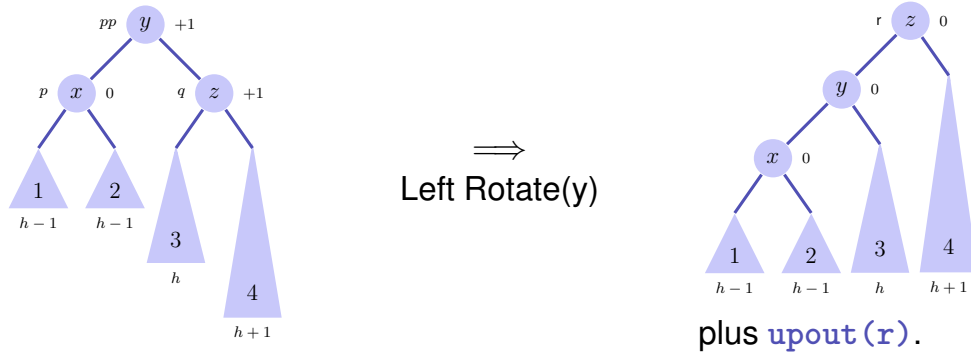

511

<sup>33</sup>(b).3.1:  $\text{bal}(pp) = -1, \text{bal}(q) = -1$ , Right rotation

512

## upout (p)

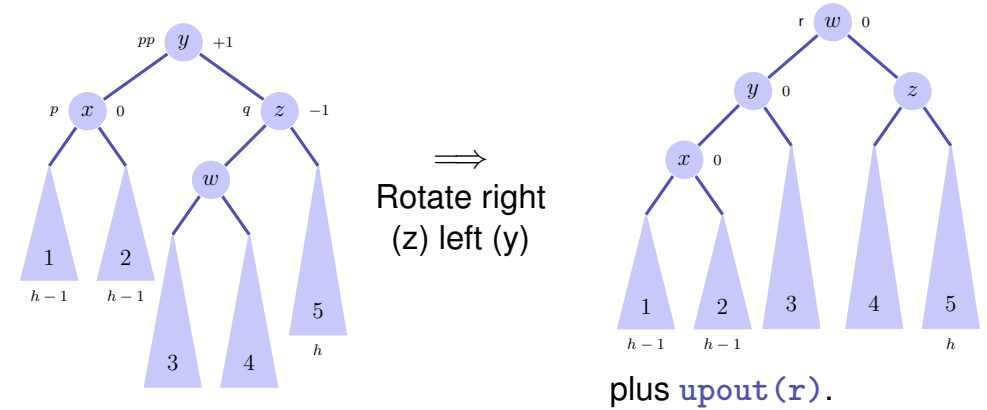

Case (a).3:  $\text{bal}(pp) = +1$ . (a).3.2:  $\text{bal}(q) = +1$ .<sup>34</sup>

<sup>34</sup>(b).3.2:  $\text{bal}(pp) = -1$ ,  $\text{bal}(q) = +1$ , Right rotation+upout

## upout (p)

Case (a).3:  $\text{bal}(pp) = +1$ . (a).3.3:  $\text{bal}(q) = -1$ .<sup>35</sup>

<sup>35</sup>(b).3.3:  $\text{bal}(pp) = -1$ ,  $\text{bal}(q) = -1$ , left-right rotation + upout

## Conclusion

- AVL trees have worst-case asymptotic runtimes of  $\mathcal{O}(\log n)$  for searching, insertion and deletion of keys.
- Insertion and deletion is relatively involved and an overkill for really small problems.

## 17.5 Appendix

Derivation of some mathematical formulas

## [Fibonacci Numbers: closed form]

Closed form of the Fibonacci numbers: computation via generation functions:

### 1 Power series approach

$$f(x) := \sum_{i=0}^{\infty} F_i \cdot x^i$$

517

## [Fibonacci Numbers: closed form]

- 2 For Fibonacci Numbers it holds that  $F_0 = 0$ ,  $F_1 = 1$ ,  $F_i = F_{i-1} + F_{i-2} \forall i > 1$ . Therefore:

$$\begin{aligned} f(x) &= x + \sum_{i=2}^{\infty} F_i \cdot x^i = x + \sum_{i=2}^{\infty} F_{i-1} \cdot x^i + \sum_{i=2}^{\infty} F_{i-2} \cdot x^i \\ &= x + x \sum_{i=2}^{\infty} F_{i-1} \cdot x^{i-1} + x^2 \sum_{i=2}^{\infty} F_{i-2} \cdot x^{i-2} \\ &= x + x \sum_{i=0}^{\infty} F_i \cdot x^i + x^2 \sum_{i=0}^{\infty} F_i \cdot x^i \\ &= x + x \cdot f(x) + x^2 \cdot f(x). \end{aligned}$$

518

## [Fibonacci Numbers: closed form]

### 3 Thus:

$$\begin{aligned} f(x) \cdot (1 - x - x^2) &= x. \\ \Leftrightarrow f(x) &= \frac{x}{1 - x - x^2} = -\frac{x}{x^2 + x - 1} \end{aligned}$$

with the roots  $-\phi$  and  $-\hat{\phi}$  of  $x^2 + x - 1$ ,

$$\phi = \frac{1 + \sqrt{5}}{2} \approx 1.6, \quad \hat{\phi} = \frac{1 - \sqrt{5}}{2} \approx -0.6.$$

it holds that  $\phi \cdot \hat{\phi} = -1$  and thus

$$f(x) = -\frac{x}{(x + \phi) \cdot (x + \hat{\phi})} = \frac{x}{(1 - \phi x) \cdot (1 - \hat{\phi} x)}$$

519

## [Fibonacci Numbers: closed form]

### 4 It holds that:

$$(1 - \hat{\phi} x) - (1 - \phi x) = \sqrt{5} \cdot x.$$

Damit:

$$\begin{aligned} f(x) &= \frac{1}{\sqrt{5}} \frac{(1 - \hat{\phi} x) - (1 - \phi x)}{(1 - \phi x) \cdot (1 - \hat{\phi} x)} \\ &= \frac{1}{\sqrt{5}} \left( \frac{1}{1 - \phi x} - \frac{1}{1 - \hat{\phi} x} \right) \end{aligned}$$

520

## [Fibonacci Numbers: closed form]

5 Power series of  $g_a(x) = \frac{1}{1-ax}$  ( $a \in \mathbb{R}$ ):

$$\frac{1}{1-ax} = \sum_{i=0}^{\infty} a^i \cdot x^i.$$

E.g. Taylor series of  $g_a(x)$  at  $x = 0$  or like this: Let  $\sum_{i=0}^{\infty} G_i \cdot x^i$  a power series of  $g$ . By the identity  $g_a(x)(1-ax) = 1$  it holds that for all  $x$  (within the radius of convergence)

$$1 = \sum_{i=0}^{\infty} G_i \cdot x^i - a \cdot \sum_{i=0}^{\infty} G_i \cdot x^{i+1} = G_0 + \sum_{i=1}^{\infty} (G_i - a \cdot G_{i-1}) \cdot x^i$$

For  $x = 0$  it follows  $G_0 = 1$  and for  $x \neq 0$  it follows then that  $G_i = a \cdot G_{i-1} \Rightarrow G_i = a^i$ .

521

## [Fibonacci Numbers: closed form]

6 Fill in the power series:

$$\begin{aligned} f(x) &= \frac{1}{\sqrt{5}} \left( \frac{1}{1-\phi x} - \frac{1}{1-\hat{\phi}x} \right) = \frac{1}{\sqrt{5}} \left( \sum_{i=0}^{\infty} \phi^i x^i - \sum_{i=0}^{\infty} \hat{\phi}^i x^i \right) \\ &= \sum_{i=0}^{\infty} \frac{1}{\sqrt{5}} (\phi^i - \hat{\phi}^i) x^i \end{aligned}$$

Comparison of the coefficients with  $f(x) = \sum_{i=0}^{\infty} F_i \cdot x^i$  yields

$$F_i = \frac{1}{\sqrt{5}} (\phi^i - \hat{\phi}^i).$$

522
