

14. Flow in Networks

Flow Network, Maximal Flow, Cut, Rest Network, Max-flow Min-cut Theorem, Ford-Fulkerson Method, Edmonds-Karp Algorithm, Maximal Bipartite Matching [Ottman/Widmayer, Kap. 9.7, 9.8.1], [Cormen et al, Kap. 26.1-26.3]

Motivation

- Modelling flow of fluents, components on conveyors, current in electrical networks or information flow in communication networks.
- Connectivity of Communication Networks, Bipartite Matching, Circulation, Scheduling, Image Segmentation, Baseball Elimination...

Flow Network

- **Flow network** $G = (V, E, c)$: directed graph with **capacities**
- Antiparallel edges forbidden:
 $(u, v) \in E \Rightarrow (v, u) \notin E$.
- Model a missing edge (u, v) by $c(u, v) = 0$.
- **Source** s and **sink** t : special nodes.
Every node v is on a path between s and t : $s \rightsquigarrow v \rightsquigarrow t$

Flow

A *Flow* $f : V \times V \rightarrow \mathbb{R}$ fulfills the following conditions:

- *Bounded Capacity:*

For all $u, v \in V$: $f(u, v) \leq c(u, v)$.

- *Skew Symmetry:*

For all $u, v \in V$: $f(u, v) = -f(v, u)$.

- *Conservation of flow:*

For all $u \in V \setminus \{s, t\}$:

$$\sum_{v \in V} f(u, v) = 0.$$

Value of the flow:

$$|f| = \sum_{v \in V} f(s, v).$$

Here $|f| = 18$.

How large can a flow possibly be?

Limiting factors: cuts

- *cut separating s from t* : Partition of V into S and T with $s \in S$, $t \in T$.
- *Capacity* of a cut: $c(S, T) = \sum_{v \in S, v' \in T} c(v, v')$
- *Minimal cut*: cut with minimal capacity.
- *Flow over the cut*: $f(S, T) = \sum_{v \in S, v' \in T} f(v, v')$

Implicit Summation

Notation: Let $U, U' \subseteq V$

$$f(U, U') := \sum_{\substack{u \in U \\ u' \in U'}} f(u, u'), \quad f(u, U') := f(\{u\}, U')$$

Thus

- $|f| = f(s, V)$
- $f(U, U) = 0$
- $f(U, U') = -f(U', U)$
- $f(X \cup Y, Z) = f(X, Z) + f(Y, Z)$, if $X \cap Y = \emptyset$.
- $f(R, V) = 0$ if $R \cap \{s, t\} = \emptyset$. [flow conversation!]

How large can a flow possibly be?

For each flow and each cut it holds that $f(S, T) = |f|$:

$$\begin{aligned} f(S, T) &= f(S, V) - \underbrace{f(S, S)}_0 = f(S, V) \\ &= f(s, V) + \underbrace{f(S - \{s\}, V)}_{\not\rightarrow t, \not\rightarrow s} = |f|. \end{aligned}$$

Maximal Flow ?

In particular, for each cut (S, T) of V .

$$|f| \leq \sum_{v \in S, v' \in T} c(v, v') = c(S, T)$$

Will discover that equality holds for $\min_{S, T} c(S, T)$.

Maximal Flow ?

Naive Procedure

Maximal Flow ?

Maximal Flow ?

Naive Procedure

Conclusion: greedy increase of flow does not solve the problem.

The Method of Ford-Fulkerson

- Start with $f(u, v) = 0$ for all $u, v \in V$
- Determine rest network* G_f and expansion path in G_f
- Increase flow via expansion path*
- Repeat until no expansion path available.

$$G_f := (V, E_f, c_f)$$
$$c_f(u, v) := c(u, v) - f(u, v) \quad \forall u, v \in V$$
$$E_f := \{(u, v) \in V \times V \mid c_f(u, v) > 0\}$$

*Will now be explained

Increase of flow, negative!

Let some flow f in the network be given.

Finding:

- Increase of the flow along some edge possible, when flow can be increased along the edge, i.e. if $f(u, v) < c(u, v)$.
Rest capacity $c_f(u, v) = c(u, v) - f(u, v) > 0$.
- Increase of flow *against the direction* of the edge possible, if flow can be reduced along the edge, i.e. if $f(u, v) > 0$.
Rest capacity $c_f(v, u) = f(u, v) > 0$.

Rest Network

Rest network G_f provided by the edges with positive rest capacity:

Rest networks provide the same kind of properties as flow networks with the exception of permitting antiparallel capacity-edges

Observation

Theorem

Let $G = (V, E, c)$ be a flow network with source s and sink t and f a flow in G . Let G_f be the corresponding rest networks and let f' be a flow in G_f . Then $f \oplus f'$ with

$$(f \oplus f')(u, v) = f(u, v) + f'(u, v)$$

defines a flow in G with value $|f| + |f'|$.

Proof

$f \oplus f'$ defines a flow in G :

■ capacity limit

$$(f \oplus f')(u, v) = f(u, v) + \underbrace{f'(u, v)}_{\leq c(u, v) - f(u, v)} \leq c(u, v)$$

■ skew symmetry

$$(f \oplus f')(u, v) = -f(v, u) + -f'(v, u) = -(f \oplus f')(v, u)$$

■ flow conservation $u \in V - \{s, t\}$:

$$\sum_{v \in V} (f \oplus f')(u, v) = \sum_{v \in V} f(u, v) + \sum_{v \in V} f'(u, v) = 0$$

Proof

Value of $f \oplus f'$

$$\begin{aligned} |f \oplus f'| &= (f \oplus f')(s, V) \\ &= \sum_{u \in V} f(s, u) + f'(s, u) \\ &= f(s, V) + f'(s, V) \\ &= |f| + |f'| \end{aligned}$$

Augmenting Paths

expansion path p : simple path from s to t in the rest network G_f .

Rest capacity $c_f(p) = \min\{c_f(u, v) : (u, v) \text{ edge in } p\}$

Flow in G_f

Theorem

The mapping $f_p : V \times V \rightarrow \mathbb{R}$,

$$f_p(u, v) = \begin{cases} c_f(p) & \text{if } (u, v) \text{ edge in } p \\ -c_f(p) & \text{if } (v, u) \text{ edge in } p \\ 0 & \text{otherwise} \end{cases}$$

provides a flow in G_f with value $|f_p| = c_f(p) > 0$.

f_p is a flow (easy to show). there is one and only one $u \in V$ with $(s, u) \in p$. Thus $|f_p| = \sum_{v \in V} f_p(s, v) = f_p(s, u) = c_f(p)$.

Consequence

Strategy for an algorithm:

With an expansion path p in G_f the flow $f \oplus f_p$ defines a new flow with value $|f \oplus f_p| = |f| + |f_p| > |f|$.

Max-Flow Min-Cut Theorem

Theorem

Let f be a flow in a flow network $G = (V, E, c)$ with source s and sink t . The following statements are equivalent:

- 1 f is a maximal flow in G*
- 2 The rest network G_f does not provide any expansion paths*
- 3 It holds that $|f| = c(S, T)$ for a cut (S, T) of G .*

Proof

- (3) \Rightarrow (1):

It holds that $|f| \leq c(S, T)$ for all cuts S, T . From $|f| = c(S, T)$ it follows that $|f|$ is maximal.

- (1) \Rightarrow (2):

f maximal Flow in G . Assumption: G_f has some expansion path
 $|f \oplus f_p| = |f| + |f_p| > |f|$. Contradiction.

Proof (2) \Rightarrow (3)

Assumption: G_f has no expansion path

Define $S = \{v \in V : \text{there is a path } s \rightsquigarrow v \text{ in } G_f\}$.

$(S, T) := (S, V \setminus S)$ is a cut: $s \in S, t \in T$.

Let $u \in S$ and $v \in T$. Then $c_f(u, v) = 0$, also

$c_f(u, v) = c(u, v) - f(u, v) = 0$. Somit $f(u, v) = c(u, v)$.

Thus

$$|f| = f(S, T) = \sum_{u \in S} \sum_{v \in T} f(u, v) = \sum_{u \in S} \sum_{v \in T} c(u, v) = C(S, T).$$

Algorithm Ford-Fulkerson(G, s, t)

Input : Flow network $G = (V, E, c)$

Output : Maximal flow f .

for $(u, v) \in E$ **do**

$f(u, v) \leftarrow 0$

while Exists path $p : s \rightsquigarrow t$ in rest network G_f **do**

$c_f(p) \leftarrow \min\{c_f(u, v) : (u, v) \in p\}$

foreach $(u, v) \in p$ **do**

if $(u, v) \in E$ **then**

$f(u, v) \leftarrow f(u, v) + c_f(p)$

else

$f(v, u) \leftarrow f(v, u) + c_f(p)$

Analysis

- The Ford-Fulkerson algorithm does not necessarily have to converge for irrational capacities. For integers or rational numbers it terminates.
- For an integer flow, the algorithm requires maximally $|f_{\max}|$ iterations of the while loop (because the flow increases minimally by 1). Search a single increasing path (e.g. with DFS or BFS) $\mathcal{O}(|E|)$ Therefore $\mathcal{O}(f_{\max}|E|)$.

With an unlucky choice the algorithm may require up to 2000 iterations here.

Edmonds-Karp Algorithm

Choose in the Ford-Fulkerson-Method for finding a path in G_f the expansion path of shortest possible length (e.g. with BFS)

Edmonds-Karp Algorithm

Theorem

When the Edmonds-Karp algorithm is applied to some integer valued flow network $G = (V, E)$ with source s and sink t then the number of flow increases applied by the algorithm is in $\mathcal{O}(|V| \cdot |E|)$.

\Rightarrow Overall asymptotic runtime: $\mathcal{O}(|V| \cdot |E|^2)$

[Without proof]

Application: maximal bipartite matching

Given: bipartite undirected graph $G = (V, E)$.

Matching M : $M \subseteq E$ such that $|\{m \in M : v \in m\}| \leq 1$ for all $v \in V$.

Maximal Matching M : Matching M , such that $|M| \geq |M'|$ for each matching M' .

Corresponding flow network

Construct a flow network that corresponds to the partition L, R of a bipartite graph with source s and sink t , with directed edges from s to L , from L to R and from R to t . Each edge has capacity 1.

Integer number theorem

Theorem

If the capacities of a flow network are integers, then the maximal flow generated by the Ford-Fulkerson method provides integer numbers for each $f(u, v)$, $u, v \in V$.

[without proof]

Consequence: Ford-Fulkerson generates for a flow network that corresponds to a bipartite graph a maximal matching

$$M = \{(u, v) : f(u, v) = 1\}.$$
