

# 5. Sorting

Simple Sorting, Quicksort, Mergesort

# Problem

**Input:** An array  $A = (A[1], \dots, A[n])$  with length  $n$ .

**Output:** a permutation  $A'$  of  $A$ , that is sorted:  $A'[i] \leq A'[j]$  for all  $1 \leq i \leq j \leq n$ .

# Selection Sort

5 6 2 8 4 1 ( $i = 1$ )  
↑

- Iterative procedure as for Bubblesort.

# Selection Sort

5 6 2 8 4 1 ( $i = 1$ )

A diagram illustrating the first step of Selection Sort. It shows a sequence of six numbers: 5, 6, 2, 8, 4, and 1. Each number is enclosed in a square box. A red arrow points upwards to the box containing the number 5. The box containing the number 1 has a light red background. To the right of the boxes is the text  $(i = 1)$ .

- Iterative procedure as for Bubblesort.
- Selection of the smallest (or largest) element by immediate search.

# Selection Sort

5 6 2 8 4 1 ( $i = 1$ )

# Insertion Sort

② What is the disadvantage of this algorithm compared to sorting by selection?

# Insertion Sort

❓ What is the disadvantage of this algorithm compared to sorting by selection?

❗ Many element movements in the worst case.

❓ What is the advantage of this algorithm compared to selection sort?

# Insertion Sort

② What is the disadvantage of this algorithm compared to sorting by selection?

⚠ Many element movements in the worst case.

② What is the advantage of this algorithm compared to selection sort?

⚠ The search domain (insertion interval) is already sorted.  
Consequently: binary search possible.

# Algorithm: Insertion Sort

**Input :** Array  $A = (A[1], \dots, A[n])$ ,  $n \geq 0$ .

**Output :** Sorted Array  $A$

**for**  $i \leftarrow 2$  **to**  $n$  **do**

$x \leftarrow A[i]$

$p \leftarrow \text{BinarySearch}(A[1..i-1], x)$ ; // Smallest  $p \in [1, i]$  with  $A[p] \geq x$

**for**  $j \leftarrow i - 1$  **downto**  $p$  **do**

$A[j + 1] \leftarrow A[j]$

$A[p] \leftarrow x$

*Worst case.*

# Analysis: number comparisons

*Best case.* Pivot = median; number comparisons:

$$T(n) = 2T(n/2) + c \cdot n, T(1) = 0 \quad \Rightarrow \quad T(n) \in \mathcal{O}(n \log n)$$

*Worst case.* Pivot = min or max; number comparisons:

$$T(n) = T(n - 1) + c \cdot n, T(1) = 0 \quad \Rightarrow \quad T(n) \in \Theta(n^2)$$

# Analysis (randomized quicksort)

## Theorem

*On average randomized quicksort requires  $\mathcal{O}(n \cdot \log n)$  comparisons.*

# Practical considerations

Worst case recursion depth  $n - 1^4$ . Then also a memory consumption of  $\mathcal{O}(n)$ .

Can be avoided: recursion only on the smaller part. Then guaranteed  $\mathcal{O}(\log n)$  worst case recursion depth and memory consumption.

---

<sup>4</sup>stack overflow possible!

# Practical considerations.

Practically the pivot is often the median of three elements. For example:  $\text{Median3}(A[l], A[r], A[\lfloor l + r/2 \rfloor])$ .

## 5.2 Mergesort

[Ottman/Widmayer, Kap. 2.4, Cormen et al, Kap. 2.3],

# Mergesort

Divide and Conquer!

- Assumption: two halves of the array  $A$  are already sorted.
- Minimum of  $A$  can be evaluated with two comparisons.
- Iteratively: sort the pre-sorted array  $A$  in  $\mathcal{O}(n)$ .

# Merge

# Merge

# Merge

# Algorithm Merge( $A, l, m, r$ )

**Input :** Array  $A$  with length  $n$ , indexes  $1 \leq l \leq m \leq r \leq n$ .  $A[l, \dots, m]$ ,  
 $A[m + 1, \dots, r]$  sorted

**Output :**  $A[l, \dots, r]$  sorted

1  $B \leftarrow$  new Array( $r - l + 1$ )

2  $i \leftarrow l$ ;  $j \leftarrow m + 1$ ;  $k \leftarrow 1$

3 **while**  $i \leq m$  and  $j \leq r$  **do**

4     **if**  $A[i] \leq A[j]$  **then**  $B[k] \leftarrow A[i]$ ;  $i \leftarrow i + 1$

5     **else**  $B[k] \leftarrow A[j]$ ;  $j \leftarrow j + 1$

6      $k \leftarrow k + 1$ ;

7 **while**  $i \leq m$  **do**  $B[k] \leftarrow A[i]$ ;  $i \leftarrow i + 1$ ;  $k \leftarrow k + 1$

8 **while**  $j \leq r$  **do**  $B[k] \leftarrow A[j]$ ;  $j \leftarrow j + 1$ ;  $k \leftarrow k + 1$

9 **for**  $k \leftarrow l$  **to**  $r$  **do**  $A[k] \leftarrow B[k - l + 1]$

# Correctness

Hypothesis: after  $k$  iterations of the loop in line 3  $B[1, \dots, k]$  is sorted and  $B[k] \leq A[i]$ , if  $i \leq m$  and  $B[k] \leq A[j]$  if  $j \leq r$ .

Proof by induction:

*Base case:* the empty array  $B[1, \dots, 0]$  is trivially sorted.

*Induction step* ( $k \rightarrow k + 1$ ):

- wlog  $A[i] \leq A[j]$ ,  $i \leq m, j \leq r$ .
- $B[1, \dots, k]$  is sorted by hypothesis and  $B[k] \leq A[i]$ .
- After  $B[k + 1] \leftarrow A[i]$   $B[1, \dots, k + 1]$  is sorted.
- $B[k + 1] = A[i] \leq A[i + 1]$  (if  $i + 1 \leq m$ ) and  $B[k + 1] \leq A[j]$  if  $j \leq r$ .
- $k \leftarrow k + 1, i \leftarrow i + 1$ : Statement holds again.

# Analysis (Merge)

## Lemma

*If: array  $A$  with length  $n$ , indexes  $1 \leq l < r \leq n$ .  $m = \lfloor (l + r)/2 \rfloor$  and  $A[l, \dots, m]$ ,  $A[m + 1, \dots, r]$  sorted.*

*Then: in the call of  $\text{Merge}(A, l, m, r)$  a number of  $\Theta(r - l)$  key movements and comparisons are executed.*

Proof: straightforward (Inspect the algorithm and count the operations.)

**else**

$r \leftarrow n$

**until**  $l = 1$

# Analysis

In the best case, natural merge sort requires only  $n - 1$  comparisons.

In the worst case and on average, natural merge sort requires  $\Theta(n \log n)$  comparisons and memory movements.
