## Lists Advanced Concepts

## 2-Dimensional Lists

So far lists contain numbers or characters

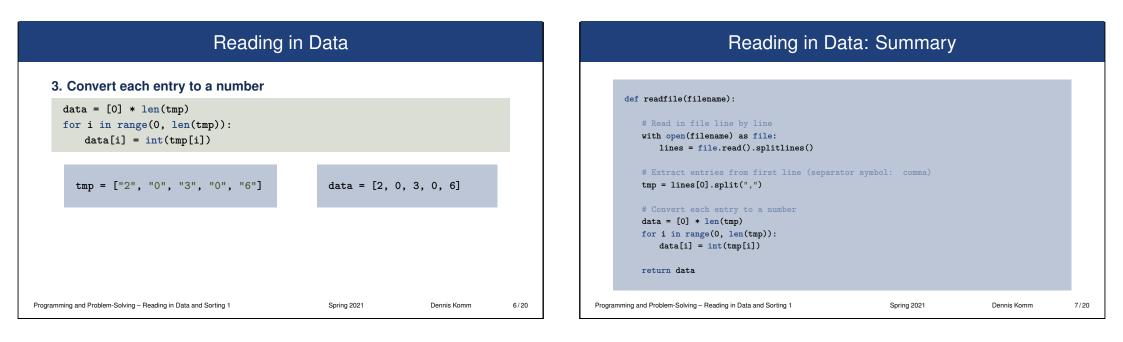

- Lists can contain lists
- Such 2-dimensional lists store, e.g., tables and matrices

 $M = \begin{pmatrix} 2 & 0 & 3 & 0 & 6 \\ 3 & 9 & 5 & 1 & 1 \\ 0 & 0 & 7 & 2 & 7 \\ 3 & 9 & 5 & 8 & 0 \\ 8 & 2 & 0 & 3 & 2 \\ 1 & 6 & 5 & 9 & 6 \end{pmatrix}$ M = [ [2, 0, 3, 0, 6], [3, 9, 5, 1, 1], [0, 0, 7, 2, 7], [3, 9, 5, 8, 0], [8, 2, 0, 3, 2], [1, 6, 5, 9, 6] ] M = **Accessing line i and column j with M[i][j]** Programming and Problem-Solving - Reading in Data and Sorting 1 Spring 2021 Dennis Komm

# Sorting 1 Sorting and Searching

## Sorting and Searching

Sorting and searching data are two of the fundamental tasks of computer scientists

## Bubblesort

#### Idea

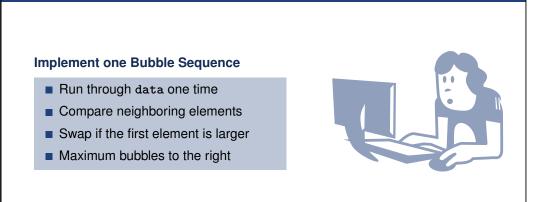

Sorting by repeatedly finding the maximum

#### Goal

#### Sort list data with n elements, i.e., range $0, \ldots, n-1$

- Find maximum and slide it to the last position
- To this end, iteratively compare neighboring elements
- Maximum travels through list to the last position like a bubble
- **Repeat with range**  $0, \ldots, n-2$
- Continue until data is sorted
- Programming and Problem-Solving Reading in Data and Sorting 1

Bubblesort						
<pre>def bubblesort(data):</pre>						
<pre>n = len(data) for d in range(n, 1, -1):     for i in range(0, d-1):</pre>						
<pre>if data[i] &gt; data[i+1]:     tmp = data[i]     data[i] = data[i+1]</pre>						
data[i+1] = tmp return data						
<pre>print(bubblesort([6, 22, 61, 1, 89, 31, 9</pre>	9, 10, 76]))					
Programming and Problem-Solving – Reading in Data and Sorting 1	Spring 2021	Dennis Komm	16/20			

## Minsort

#### Idea

Sorting by repeatedly finding the minimum

- Unlike Bubblesort, we do not compare neighboring elements
- Current minimum is stored
- Each element is compared to it
- If it is smaller, both are swapped
- After one iteration, the minimum is copied to (current) first position
- Continue until data is sorted

Spring 2021

nnis Komm 17/20

Minsort

def minsort(data):	
n = len(data)	
for current in range(0, n-1):	
minimum = data[current]	
<pre>for i in range(current+1, n):</pre>	
if data[i] < minimum:	
<pre>tmp = data[i]</pre>	
data[i] = minimum	
minimum = tmp	
data[current] = minimum	
return data	
<pre>print(minsort([6, 22, 61, 1, 89, 31, 9, 10, 76]))</pre>

Spring 2021 Dennis Komm

## Sorting 1 Time Complexity of Bubblesort

## Time Complexity of Bubblesort

#### Count comparisons of two numbers

- n-1 comparisons to find maximum
- n-2 comparisons to find second largest element

• • • •

- 1 comparison to find smallest element
- $\Rightarrow \ \sum_{i=1}^{n-1} i = (n-1) \cdot n/2 = (n^2-n)/2$  comparisons in total
- $\Rightarrow$  Quadratic number of comparisons

The time complexity of Bubblesort is in  $\mathcal{O}(n^2)$ 

With similar arguments, the time complexity of Minsort is in  $\mathcal{O}(n^2)$
